To run Visual Studio Code from the terminal, you can use the `code` command. First, you'll need to make sure that Visual Studio Code is added to your system's PATH. Once that's done, you can simply open a terminal and type `code .` to open the current directory in Visual Studio Code. If you want to open a specific folder, you can type `code path_to_folder`. This will launch Visual Studio Code with the specified folder open.

How to run the program in Visual Studio Code Terminal?

1. Open the VS code first.

2. Click on the **Manage icon** in the below left.

3. Then click on the **Settings** option or press shortcut key **ctrl + ,**

4. Search '**Run In Terminal**' and scroll down then you will see 'Code-runner: Run In Terminal'

5. Click on the **box icon**. After this 'Run In Terminal' setting is turned on.

Then reopen your Visual Studio Code. Now, your program output will show in Terminal.

In CMD, you can simply write "**code**" or if you want to open a directory, then you should first navigate to the path, then write "**code .**" and execute this command.

Related How do I open VS code from terminal Ubuntu?

Try this. To open VS code with the current directory treated as the root directory in the file browser

```
1 $code .
```

Replace the '.' character with a path to a directory to open that directory as the root directory in the file browser. Or if you simply wish to open a file

```
1 $code myFile.txt
```

How do I create a mind map?

Mind maps are the perfect tool for visualizing thoughts and ideas, but they can be a bit daunting to build, especially if you're trying to solve a complex problem. Here are some best practices to keep in mind:

1. **Define your central idea.** All good mindmaps stem from the core issue or problem you want to expand on. Think about *what* you're trying to solve for and *why*. A common best practice is to format your issue into a question that sits in the center

just open the directory from where you want to launch the Visual Studio Code, and open a terminal from there and type:

```
1 code .
```

This will open code with the same folder as your terminal or cmd points to.

Now you can write code without the '.', but that'll open code in the last state.

Hope this will solve many people's problem.

Just open your terminal or shell by pressing (ubuntu) ctrl+alt+t or in windows just type cmd in search. As terminal opens just type "code" and press enter, VS code will open.

Happy coding!!!

To my knowledge you just run the command "code" from terminal but if you don't have installed yet you can use the code below to install the package.

```
1 sudo snap install code --classic
```
